

## SYSLOG

### SYSLOG OVERVIEW

- SYSLOG is an INDUSTRY-STANDARD PROTOCOL for message logging
- On NETWORK DEVICES, SYSLOG can be used to LOG EVENTS
  - Changes in INTERFACE status (UP / DOWN)
  - Changes in OSPF NEIGHBOUR STATUS (UP / DOWN)
  - System Restarts
  - etc...
- The messages can be displayed in the CLI, saved in the DEVICE'S RAM or sent to an external SYSLOG SERVER

```
R1(config)#int g0/0
R1(config-if)#no shutdown
R1(config-if)#
*Feb 11 03:02:55.304: %LINK-3-UPDOWN: Interface GigabitEthernet0/0, changed state to up
*Feb 11 03:02:56.305: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet0/0, changed state to up
```

- Logs are essential when troubleshooting issues, examining the cause of incidents, etc.
- SYSLOG and SNMP are both used for MONITORING and TROUBLESHOOTING of DEVICES. They are complementary, but their functionalities are different

### SYSLOG MESSAGE FORMAT

**seq: time stamp: %facility-severity-MNEMONIC:description**

💡 These TWO FIELDS may or may not be displayed, depending on the DEVICE'S configuration  
seq = A SEQUENCE NUMBER indicating the order / sequence of messages

time stamp = A TIMESTAMP indicating the time the message was generated

facility = A VALUE that indicates which process on the DEVICE generated the message

severity = A NUMBER that indicates the severity of a logged event.

Official RFC for SYSLOG severity levels

💡 LEVELS and KEYWORDS need to be MEMORIZED for the CCNA

## Syslog Severity Levels

Level	Keyword	Description
0	<b>Emergency</b>	System is unusable
1	<b>Alert</b>	Action must be taken immediately
2	<b>Critical</b>	Critical conditions
3	<b>Error</b>	Error conditions
4	<b>Warning</b>	Warning conditions
5	<b>Notice</b>	Normal but significant condition ( <b>Notification</b> )
6	<b>Informational</b>	Informational messages
7	<b>Debugging</b>	Debug-level messages

💡 MEMORIZATION MNEMONIC : (E)very (A)wesome (C)isco (E)ngineer (W)ill (N)eedy (I)ce cream (D)aily

MNEMONIC = A SHORT CODE for the message, indicating what happened

description = Detailed information about the EVENT being reported

## Syslog Message Examples

seq:**time stamp:** %**facility**-**severity**-**MNEMONIC**:**description**

\*Feb 11 03:02:55.304: %LINK-3-UPDOWN: Interface GigabitEthernet0/0, changed state to up

\*Feb 11 05:04:39.606: %OSPF-5-ADJCHG: Process 1, Nbr 192.168.1.2 on GigabitEthernet0/0 from LOADING to FULL, Loading Done

000043: \*Feb 11 05:06:43.331: %SYS-5-CONFIG\_I: Configured from console by jeremy on console

\*Feb 11 07:27:23.346: %SYS-6-CLOCKUPDATE: System clock has been updated from 07:27:23 UTC Thu Feb 11 2021 to 16:27:23 JST Thu Feb 11 2021, configured from console by jeremy on console.

### SYSLOG LOGGING LOCATIONS

- CONSOLE LINE
  - SYSLOG messages will be displayed in the CLI when connected to the DEVICE via the CONSOLE port. By DEFAULT, all messages (Level 0-7) are displayed
- BUFFER
  - Syslog messages will be saved to RAM. By default, ALL messages (Level 0-7) are displayed
- VTY LINES

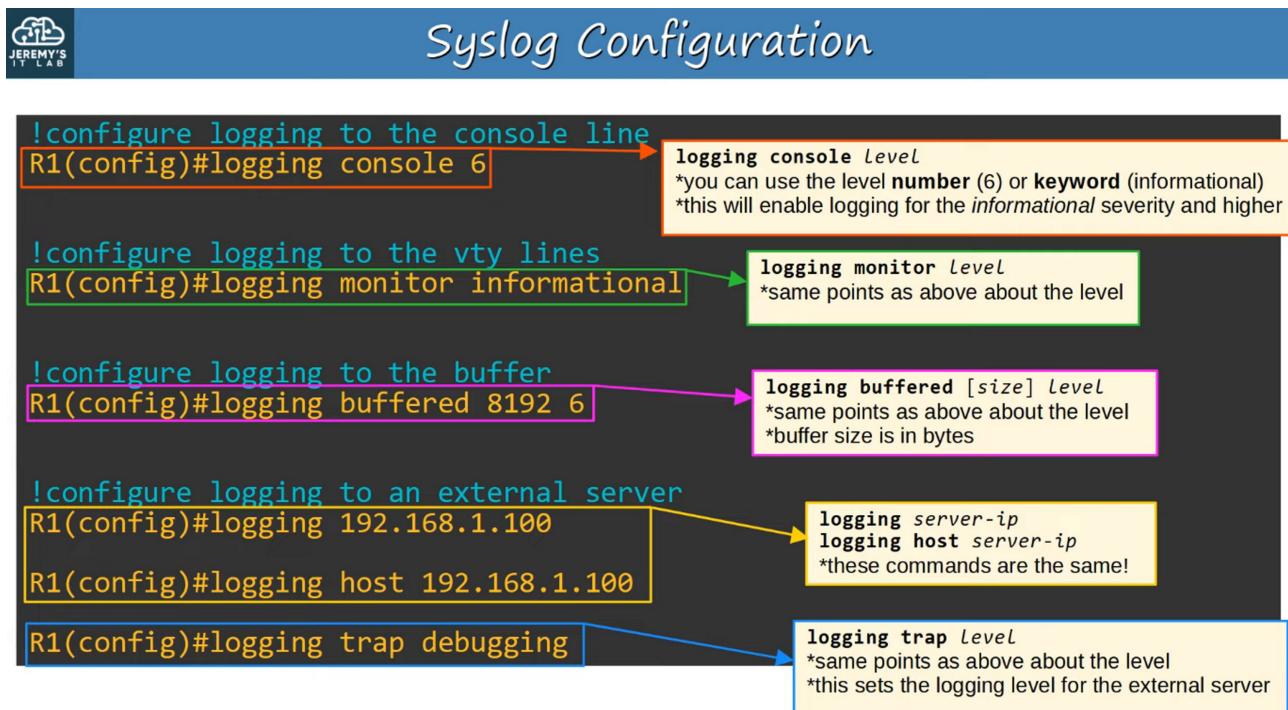

- SYSLOG messages will be displayed in the CLI when connected to the DEVICE via Telnet/SSH (coming in a later video). Disabled by default.

- EXTERNAL SERVER

- You can configure the DEVICE to send SYSLOG messages to an external server

\*\* SYSLOG SERVERS will listen for messages on UDP PORT 514 \*\*

## SYSLOG CONFIGURATION

level works from the chosen level and upward toward Level 0 (EMERGENCY)

level or keyword from the Severity Table works when choosing a level

## TERMINAL MONITOR

- Even if logging monitor level is enabled, by default SYSLOG messages will not be displayed when connected via Telnet or SSH
- For the messages to be displayed, you must use the following command:
  - R1# terminal monitor
- The command must be used every time you connect to the DEVICE via Telnet or SSH

## LOGGING SYNCHRONOUS

- By default, logging messages displayed in the CLI while you are in the middle of typing a command will result in something like this:

```

R1(config)#exit
R1#show ip in
*Feb 11 09:38:41.607: %SYS-5-CONFIG_I: Configured from console by jeremy on
consoleinterface brief
  
```

- To prevent this, you should use logging synchronous on the appropriate *line*

```

R1(config)#line console 0
R1(config-line)#logging synchronous
  
```

- This will cause a new line to be printed if your typing is interrupted by a message

```

R1(config)#exit
R1#show ip int
*Feb 11 09:41:00.554: %SYS-5-CONFIG_I: Configured from console by jeremy on console
R1#show ip int
  
```

## SERVICE TIMESTAMPS and SERVICE SEQUENCE-NUMBERS

### service timestamps / service sequence-numbers

```
R1(config)#service timestamps log ?
  datetime  Timestamp with date and time
  uptime    Timestamp with system uptime
<cr>
```

**datetime** = timestamps will display the date/time when the event occurred.  
**uptime** = timestamps will display how long the device had been running when the event occurred.

```
R1(config)#service timestamps log datetime
R1(config)#
R1(config)#service sequence-numbers
R1(config)#exit
R1#
000039: *Feb 11 10:32:46: %SYS-5-CONFIG_I: Configured from console by
jeremy on console
```

## SYSLOG versus SNMP

- SYSLOG and SNMP are both used for MONITORING and TROUBLESHOOTING of DEVICES. They are COMPLIMENTARY, but their FUNCTIONALITIES are different.
- SYSLOG
  - Used for MESSAGE LOGGING
  - Events that occur within the system are categorized based on FACILITY / SEVERITY and LOGGED
  - Used for SYSTEM MANAGEMENT, ANALYSIS, and TROUBLESHOOTING
  - Messages are sent from the DEVICES to the SERVER.
    - The SERVER can't actively pull information from the DEVICES (like SNMP 'get') or modify variables (like SNMP 'set')
- SNMP
  - Used to retrieve and organize information about the SNMP managed DEVICES
    - IP ADDRESSES
    - Current INTERFACE status
    - Temperature
    - CPU Usage
    - etc...
  - SNMP SERVERS can use Get to query the CLIENTS and Set to MODIFY variables on the CLIENTS
