

## ✓ What is the AppData Folder?

- **AppData** stands for **Application Data**.
- It is a **hidden system folder** in Windows where **applications store data** related to user settings, temporary files, logs, cache, etc.

Each user account has its **own AppData folder**, meaning settings are kept separate for different users.

## 📁 Location:

C:\Users\<YourUsername>\AppData

To open it quickly:

- Press **Windows + R**
- Type **appdata** and press **Enter**

## AppData Has 3 Subfolders:

Each one stores different types of data for installed applications:

### 1. Local Folder

- 🧠 **What it does:** Stores data that is **specific to your computer**.
- 🔄 It **does not sync** with your Microsoft account.
- 📦 Examples:

- Cache files
- Application logs
- Temp data from browsers or games

- 📍 Path:

C:\Users\<YourName>\AppData\Local

💡 Example: Chrome stores cache here. If you delete it, Chrome will recreate it, but you'll lose temporary data.

### 2. LocalLow Folder

- 🗝️ **What it does:** Stores data for **low-permission apps**.

-  Used by software that runs in **more secure (restricted) mode**.
-  Examples:
  - Unity-based games
  - Internet Explorer's protected mode data
-  Path:  
 C:\Users\<YourName>\AppData\LocalLow  
 LocalLow = "Low Integrity", meaning the app has limited access to the system.

### 3. Roaming Folder

-  **What it does:** Stores **user-specific settings** that can **sync across devices** using your Microsoft account.
-  Ideal for **user profiles** or **app settings** that you want to keep the same on multiple PCs.
-  Examples:
  - Microsoft Outlook data
  - Browsers like Firefox (profiles and bookmarks)
  - App configuration files
-  Path:  
 C:\Users\<YourName>\AppData\Roaming  
 "Roaming" means your settings follow you if you log in to another PC with the same account.

### Why AppData is Important:

- Used by software like Chrome, Zoom, Discord, MS Office, etc.
- Keeps your personal settings, like bookmarks, preferences, chat logs.
- Helps in troubleshooting or restoring application data.

### Important Notes:

- It's **hidden by default** to prevent accidental changes.
- Don't delete or modify contents unless you know what you're doing — it may cause programs to break.
